Instituto. Conventional feedhoses used for

conveying fluids, such as liquids and gases, have been produced from elastomeric material in a round or oval configuration. These

conventional feedhoses have

---

an outer diameter, which is typically slightly larger than the inner diameter of the supporting hose or conduit.

These conventional feedhoses are known to leak when subjected to tensile forces such as those which occur when the hose is axially compressed, or when the hose is used to convey fluids. These conventional feedhoses often fail to relieve the tensile forces acting on the hose, and thus do not provide an even flow of the fluid that can be conveyed in the hose. It is well known that in the case of compressed gasses, like air, these feedhoses tend to collapse at the elbow and feet of the hose, resulting in an uneven and irregular flow of the compressed gas. Additionally, conventional feedhoses are often

---

manufactured by molding the hose in a fixed shape, a process which renders it unsuitable for custom or aftermarket modification.

Thus, once a feedhose is molded in a particular shape, it must be discarded and replaced by a new hose having the same shape. This is most undesirable in the medical application of feedhoses, since a single feedhose is not reusable.

This particular problem arises because traditional feedhoses have a fixed diameter and a fixed axial length. Additionally, conventional feedhoses typically use an inner tubing material, which is generally thinner than the outer hose material. This makes the feedhose more flexible, but increases the likelihood of splitting and cracking of the

---

outer hose material. What is needed is an improved feedhose that overcomes these disadvantages.

Additionally, these conventional feedhoses are

fake@porndownload.hr This invention relates to an image pickup system, and more particularly to a conversion of a conventional film type image pickup system to an electronic type image pickup system. In the conventional film-based photo film camera, a film with an image thereon

---

is wound into a light-tight chamber, and the taken picture is exposed to the ambient light outside the chamber and, if necessary, the picture is taken through a taking lens. Since an image of a brightness is formed on the film by the ambient light, there is a limitation to a degree of brightness of the picture. To eliminate this drawback, a flashlight device, for example, a battery-driven flash lamp, may be employed in the chamber for supplementing the ambient light in taking the picture. Therefore, it is not absolutely necessary to provide the photographer with a taken picture with a correct exposure at the time of taking the picture. In other words, the photographer can control the shutter time of the taken picture from the flashing of the lamp so that an image with correct brightness can be obtained. In the conventional film type, a user, who understands how the picture is taken, controls the shutter time in association with the light value of the taken picture. Accordingly, in many cases, the photographer can take a good picture by properly selecting the shutter time without paying any attention to exposure measuring. The conventional film type has not been able to provide a continuous shooting, that is, the capability of continuously taking a picture, as it is necessary to

---

take pictures one by one. On the other hand, in the electronic image pickup device, such as CCD camera, a CCD sensor, for example, is provided for converting an optical image to an electric signal, and the converted electric signal is stored in the form of an electric charge corresponding to the quantity of the incident light

Privacy Act: Definitions of terms used:  
Nucleus: any nucleus of any cell of the body, including the cell body and all internal organelles and membranes.  
Cilia: a slender cylindrical hair-like extension, found in most animal cells

---

and some other organisms, that extends from the cell body. Microvilli:

(1) A projection, or a group of projections, of cells lining the wall of a tube or channel. (2) A single projection of cells lining the wall of a tube or channel. Cenote: an artificially created underwater grotto. A cenote is where the thick limestone limestone layer that formed before the last collision has not been covered by younger, softer sediments. These hard layers of limestone are still in place and are visible, as are the small "channels" (cenotes) made by the water. The term "limestone" means a sedimentary rock composed principally of carbonate of lime ( $\text{CaCO}_3$ ), which forms when seas deposit the remains of marine organisms. Cenote: a naturally occurring water-filled natural bowl, which can form in soil on the bed of any lake, swamp, or river. The word cenote comes from the Yucatec Maya language. Cenote: a narrow, deep canyon that is cut by a river or stream. Cenote: (southeast Mexico) a wide, shallow, natural water sink that may be hundreds of yards long and hundreds of feet wide. Cenote: (Spanish) A natural, fresh water sink (L-shaped or Y-shaped). A cenote is a large, manmade sink as well. The term is derived from the Yucatec Maya language. Cenote: (Maya) a

---

large natural lake or sink that may be hundreds of yards long and hundreds of feet wide. Cenote: an archaeological site with a body of freshwater that is from 100 to 500 feet (30-150 meters) in diameter. Cenote: (1580-1720) a deep, well-like hole dug into the ground. Cenote: (Maya) a natural sunken natural or manmade hole for collecting water or hiding from the sun. A cenote is usually between
